Abstract: Multimedia content is a central component of on-demand training and education delivered over the World Wide Web. Supporting asynchronous collaboration around educational multimedia is potentially a significant tool for delivering online educational content effectively. A multimedia annotation system tightly integrated with email provides a powerful platform on which to base such functionality. In this paper we describe a series of studies of such a system. First, we built a prototype annotation ... ([Update](#))

Context of citations to this paper: [More](#)

...we can mine user annotations for indexing terms; as multimedia annotations. **are simply meta data associated with multimedia content [1].** A major difference between conventional image annotation and this approach is the purpose of the annotation: collaborative annotations...

...and video than text, but it can be more important because multimedia is more difficult to skim. **The Microsoft MRAS annotation system [1, 2], described below, allows people to easily create and share notes that are linked to specific points or segments in a multimedia object,**...
